M A N U A L

A simple and efficient system that distributes fragrance through the existing ventilation network for an even and consistent scent experience.

Example of diffuser tubing routed to an HVAC air-handling unit

SHORT STEP-BY-STEP

- 1 Place the diffuser unit close to the air handler or duct access point.
- 2 Connect the atomizing tube from the diffuser outlet to the HVAC duct, typically on the return-air side.
- 3 Pour the fragrance oil, connect power, and secure the tubing path.
- 4 Set the schedule and intensity from the touch screen or app control.
- 5 When the HVAC runs, fragrance travels through the ductwork for even whole-space coverage.
- 6 Test once to adjust the scent intensity to your preference.
